

NEW GUIDELINES: Every battery must be insulated to help prevent short-circuiting during transit. This means you need to individually insulate each battery in one of two ways:

- ▶ Place each battery in a clear, sealable plastic bag by itself, OR
- ▶ Cover the exposed terminals with clear tape.

Clear plastic bags and scotch tape are provided at the battery recycling box. By following these simple steps, you help protect drivers, prevent accidents, and keep everyone safe!

NOT Accepted: Large batteries, such as lead acid, electronic batteries, or anything over 9 volts, and e-cigarettes/vapes.
